

## General Description

The LTC8721/LTC8722/LTC8723 are tiny, single- and dual- channel comparators with push-pull output that offer the ultimate combination of high speed (66 ns propagation delay) and very low power consumption (22  $\mu$ A), available in extremely small packages with features such as rail-to-rail inputs, low offset voltage (0.8 mV), large output drive current, and a wide range of supply voltages from 1.7 V to 5.5 V. The devices are very easy to implement in a wide variety of applications where require critical response time, power-sensitive, low-voltage, and/or tight board space.

The output of the LTC8721/LTC8722/LTC8723 pulls to within 0.1 V of either supply rail without external pull-up circuitry, making these devices ideal for interface with both CMOS and TTL logics. All input and output pins can tolerate a continuous short-circuit fault condition to either rail. Internal hysteresis ensures clean output switching, even with slow-moving input signals.

The LTC8721/LTC8723 (single) is available in both SOT23-5L and SC70-5L packages. The LTC8722 (dual) is offered in DFN-8L, SOIC-8L and MSOP-8L packages. All devices are rated over  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$  industrial temperature range.

## Features and Benefits

- Micro-power Operating Current (22  $\mu$ A) Preserves Battery Power
- Fast 66 ns Propagation Delay (100-mV Overdrive)
- Single 1.7 V to 5.5 V Supply Voltage Range
  - Can be Powered From the Same 1.8V/2.5V/3.3V/5V System Rails
- Rail-to-Rail Input
- Push-Pull Output Current Drive: 30 mA Typically at 5V Supply
- Internal Hysteresis for Clean Switching
- Internal RF/EMI Filter
- Operating Temperature Range:  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$

## Applications

- Consumer Accessories
- Handsets, Tablets and Notebooks
- Portable and Battery-Powered Devices
- Threshold Detectors and Discriminators
- Alarms and Monitoring Circuits
- Zero-Crossing Detectors
- Window Comparators
- Level Translators
- Line Receivers
- IR Receivers

## Pin Configurations (Top View)

## Pin Description

Symbol	Description
-IN	Negative input. The voltage range is from ( $V_{S-} - 0.1$ V) to ( $V_{S+} + 0.1$ V).
+IN	Positive input. This pin has the same voltage range as -IN.
+V <sub>S</sub>	Positive power supply. The voltage is from 1.7 V to 5.5 V. Split supplies are possible as long as the voltage between V <sub>S+</sub> and V <sub>S-</sub> is from 1.7 V to 5.5 V.
-V <sub>S</sub>	Negative power supply. It is normally tied to ground. It can also be tied to a voltage other than ground as long as the voltage between V <sub>S+</sub> and V <sub>S-</sub> is from 1.7 V to 5.5 V.
OUT	Comparator output.

## Ordering Information

Orderable Type Number	Package Name	Package Quantity	Eco Class <sup>(1)</sup>	Operating Temperature	Marking Code
LTC8721YT5/R6	SOT23-5L	3 000	Green	-40°C to +85°C	CG1
LTC8721YC5/R6	SC70-5L	3 000	Green	-40°C to +85°C	CG1
LTC8722YF8/R6	DFN2x2-8L	3 000	Green	-40°C to +85°C	CG2
LTC8722YS8/R8	SOIC-8L	4 000	Green	-40°C to +85°C	CG2 Y
LTC8722YV8/R6	MSOP-8	3 000	Green	-40°C to +85°C	CG2Y

LTC8723RYT5/R6	SOT23-5L	3 000	Green	-40°C to +85°C	CG0

(1) Eco Class - The planned eco-friendly classification: Pb-Free (RoHS) or Green (RoHS & Halogen Free).

(2) Please contact to your Linearin representative for the latest availability information and product content details.

## Limiting Value

In accordance with the Absolute Maximum Rating System (IEC 60134).

Parameter	Absolute Maximum Rating
Supply Voltage, V <sub>S+</sub> to V <sub>S-</sub>	10.0 V
Signal Input Terminals: Voltage, Current	V <sub>S-</sub> - 0.5 V to V <sub>S+</sub> + 0.5 V, $\pm 10$ mA
Output Short-Circuit	Continuous
Storage Temperature Range, T <sub>stg</sub>	-65 °C to +150 °C
Junction Temperature, T <sub>J</sub>	150 °C
Lead Temperature Range (Soldering 10 sec)	260 °C

## ESD Rating

Parameter	Item	Value	Unit
Electrostatic Discharge Voltage	Human body model (HBM), per MIL-STD-883J / Method 3015.9 <sup>(1)</sup>	3 000	V
	Charged device model (CDM), per ESDA/JEDEC JS-002-2014 <sup>(2)</sup>	2 000	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

## Application Notes

### OPERATING VOLTAGE

The LTC872x family of micro-power push-pull output comparators is fully specified and ensured for operation from 1.7 V to 5.5 V and offers an excellent speed-to-power combination with a propagation delay of 70 ns and a quiescent supply current of 22  $\mu$ A. This combination of fast response time at micro-power enables power conscious systems to monitor and respond quickly to fault conditions.

In addition, and many specifications apply over the industrial temperature range of  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$ . Parameters that vary significantly with operating voltages or temperature are illustrated in the Typical Characteristics graphs.

### INPUT VOLTAGE

The input common-mode voltage range of the LTC872x comparators extends 100mV beyond the supply rails. This performance is achieved with a complementary input stage: an N-channel input differential pair in parallel with a P-channel differential pair. The N-channel pair is active for input voltages close to the positive rail, typically  $V_{S+}-1.4\text{V}$  to the positive supply, whereas the P-channel pair is active for inputs from 100mV below the negative supply to approximately  $V_{S+}-1.4\text{V}$ . There is a small transition region, typically  $V_{S+}-1.2\text{V}$  to  $V_{S+}-1\text{V}$ , in which both pairs are on. This 200mV transition region can vary up to 200mV with process variation. Thus, the transition region (both stages on) can range from  $V_{S+}-1.4\text{V}$  to  $V_{S+}-1.2\text{V}$  on the low end, up to  $V_{S+}-1\text{V}$  to  $V_{S+}-0.8\text{V}$  on the high end. Within this transition region, PSRR, CMRR, offset voltage, offset drift, and THD can be degraded compared to device operation outside this region.

### INPUT VOLTAGE

The LTC8721/LTC8722/LTC8723 comparator family uses CMOS transistors at the inputs which prevent phase inversion when the input pins exceed the supply voltages.

Figure 1. Input EMI Filter and Clamp Circuit

Figure 1 shows the input EMI filter and clamp circuit. The LTC8721/LTC8722/LTC8723 comparators have

internal ESD protection diodes (D1, D2, D3, and D4) that are connected between the inputs and each supply rail. These diodes protect the input transistors in the event of electrostatic discharge and are reverse biased during normal operation. This protection scheme allows voltages as high as approximately 500mV beyond the rails to be applied at the input of either terminal without causing permanent damage. See the table of Absolute Maximum Ratings for more information.

### EMI REJECTION RATIO

Circuit performance is often adversely affected by high frequency EMI. When the signal strength is low and transmission lines are long, an amplifier must accurately amplify the input signals. However, all comparator pins — the non-inverting input, inverting input, positive supply, negative supply, and output pins — are susceptible to EMI signals. These high frequency signals are coupled into a comparator by various means, such as conduction, near field radiation, or far field radiation. For example, wires and printed circuit board (PCB) traces can act as antennas and pick up high frequency EMI signals.

Amplifiers do not amplify EMI or RF signals due to their relatively low bandwidth. However, due to the nonlinearities of the input devices, comparators can rectify these out of band signals. When these high frequency signals are rectified, they appear as a dc offset at the output.

The LTC8721/LTC8722/LTC8723 comparators have integrated EMI filters at their input stage. A mathematical method of measuring EMIRR is defined as follows:

$$EMIRR = 20 \log (V_{IN\_PEAK} / \Delta V_{OS})$$

### INTERNAL HYSTERESIS

Most high-speed comparators oscillate in the linear region because of noise or undesired parasitic feedback. This tends to occur when the voltage on one input is at or equal to the voltage on the other input. To counter the parasitic effects and noise, the devices have an internal hysteresis of 5 mV.

The hysteresis in a comparator creates two trip points: one for the rising input voltage and one for the falling input voltage. The difference between the trip points is the hysteresis. The average of the trip points is the offset voltage. When the comparator's input voltages are equal, the hysteresis effectively causes one comparator input voltage to move quickly past the other, thus taking the input out of the region where oscillation occurs. Standard comparators require hysteresis to be added with external resistors. To increase hysteresis and noise margin even more, add positive feedback with two resistors

## Application Notes

as a voltage divider from the output to the non-inverting input. Figure 2 illustrates the case where  $IN-$  is fixed and  $IN+$  is varied. If the inputs were reversed, the figure would look the same, except the output would be inverted.

Figure 2. Input and Output Waveform, Non-inverting Input Varied

### MAXIMIZING PERFORMANCE THROUGH PROPER LAYOUT

To achieve the maximum performance of the extremely high input impedance and low offset voltage of the LTC8721/LTC8722/LTC8723 devices, care is needed in laying out the circuit board. The PCB surface must remain clean and free of moisture to avoid leakage currents between adjacent traces. Surface coating of the circuit board reduces surface moisture and provides a humidity barrier, reducing parasitic resistance on the board. The use of guard rings around the comparator inputs further reduces leakage currents. Figure 3 shows proper guard ring configuration and the top view of a surface-mount layout. The guard ring does not need to be a specific width, but it should form a continuous loop around both inputs. By setting the guard ring voltage equal to the voltage at the non-inverting input, parasitic capacitance is minimized as well. For further reduction of leakage currents, components can be mounted to the PCB using Teflon standoff insulators.

Figure 3. Use a guard ring around sensitive pins

Other potential sources of offset error are thermoelectric voltages on the circuit board. This voltage,

also called Seebeck voltage, occurs at the junction of two dissimilar metals and is proportional to the temperature of the junction. The most common metallic junctions on a circuit board are solder-to-board trace and solder-to-component lead. If the temperature of the PCB at one end of the component is different from the temperature at the other end, the resulting Seebeck voltages are not equal, resulting in a thermal voltage error.

This thermocouple error can be reduced by using dummy components to match the thermoelectric error source. Placing the dummy component as close as possible to its partner ensures both Seebeck voltages are equal, thus canceling the thermocouple error. Maintaining a constant ambient temperature on the circuit board further reduces this error. The use of a ground plane helps distribute heat throughout the board and reduces EMI noise pickup.

### INPUT-TO-OUTPUT COUPLING

To minimize capacitive coupling, the input and output signal traces should not be parallel. This helps reduce unwanted positive feedback.

## Typical Application Circuits

### IR RECEIVER AFE AND WAKE-UP CIRCUIT

Infrared (IR) communication is inherently immune to RF interference as long as there is a line-of-sight path between the transmitter and the receiver. It is also one of the lowest cost communication schemes. This makes it a good choice for implementing wireless communications in applications such as utility metering. A common system topology to extend battery life is to use a power efficient IR receiver analog front end (AFE) that is always on and wakes up the host only when there is a valid IR signal detected as shown in Figure 1.

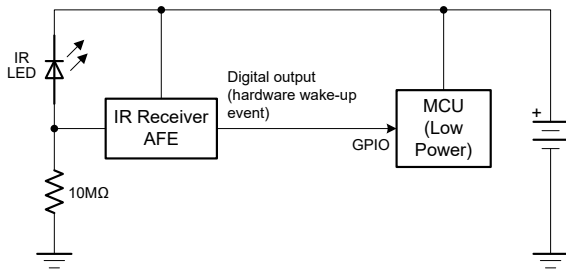

Figure 4. Coin Cell Battery Powered IR Receiver

Power efficient comparators such as the LTC872x can be used in the IR receiver AFE to increase battery life. The LTC872x device is responsible for two major tasks:

1. IR signal conditioning,
2. Host system wake-up.

The LTC872x device is constantly powered to always be ready to receive IR signals and wake up the host microcontroller (MCU) when data is received. The short working distance (approx 5 cm) is suitable for a virtual-contact operation where the IR transmitter and receiver are closely placed with an optional mechanical alignment guide.

Figure 1 shows the IR receiver system block diagram. The host MCU is normally in the shutdown mode (during which the quiescent current is less than 1  $\mu\text{A}$ ) except when data is being transferred.

Figure 2 shows the detailed circuit design. The circuit establishes a threshold through  $R_2$  and  $C_1$  which automatically adapts to the ambient light level. To further reduce BOM cost, this example uses an IR LED as the IR receiver. The IR LED is reverse-biased to function as a photodiode (but at a reduced sensitivity).

The low input bias current allows a greater load resistor value ( $R_1$ ) without sacrificing linearity, which in turn helps reduce the always-on supply current.

The load resistor  $R_1$  converts the IR light induced current into a voltage fed into the inverting input of the comparator.  $R_2$  and  $C_1$  establish a reference voltage  $V_{REF}$  which tracks the mean amplitude of the IR signal. The non-inverting input is connected to  $V_{REF}$

through  $R_3$ . And finally  $R_3$  and  $R_4$  are used to introduce additional hysteresis to keep the output free of spurious toggles.

Figure 5. IR Receiver AFE Using LTC8721

### USE WINDOW COMPARATOR TO DETECT UNDER-VOLTAGE AND OVER-VOLTAGE

Window comparators are commonly used to detect undervoltage (UV) and overvoltage (OV) conditions. Figure 6 shows a simple window comparator circuit.

Figure 6. Window Comparator

For this design, follow these design requirements:

- Alert (logic low output) when an input signal is less than 1.1 V
- Alert (logic low output) when an input signal is greater than 2.2 V
- Alert signal is active low
- Operate from a 3.3-V power supply

Configure the circuit as shown in Figure 6. Connect  $V_{S+}$  to a 3.3-V power supply and  $V_{S-}$  to ground. Make  $R_1$ ,  $R_2$  and  $R_3$  each 10-M $\Omega$  resistors. These three resistors are used to create the positive and negative thresholds for the window comparator ( $V_{TH+}$  and  $V_{TH-}$ ). With each resistor being equal,  $V_{TH+}$  is 2.2 V and  $V_{TH-}$

## Typical Application Circuits

is 1.1 V. Large resistor values such as 10-M $\Omega$  are used to minimize power consumption. The sensor output voltage is applied to the inverting and non-inverting inputs of the 2-channel LTC8722's. The respective comparator outputs will be low when the sensor is less than 1.1 V or greater than 2.2 V.  $V_{OUT}$  will be high when the sensor is in the range of 1.1 V to 2.2 V. See the application curve in Figure 7.

## IMPORTANT NOTICE

Linearin is a global fabless semiconductor company specializing in advanced high-performance high-quality analog/mixed-signal IC products and sensor solutions. The company is devoted to the innovation of high performance, analog-intensive sensor front-end products and modular sensor solutions, applied in multi-market of medical & wearable devices, smart home, sensing of IoT, and intelligent industrial & smart factory (industrie 4.0). Linearin's product families include widely-used standard catalog products, solution-based application specific standard products (ASSPs) and sensor modules that help customers achieve faster time-to-market products. Go to <http://www.linearin.com> for a complete list of Linearin product families.

For additional product information, or full datasheet, please contact with the Linearin's Sales Department or Representatives.
