

DESCRIPTION

The LTC5228 is an advanced CMOS analog switch fabricated in Sub-micron silicon gate CMOS technology. The part also features guaranteed Break Before Make (BBM) switching, assuring the switches never short the driver. The switches can handle negative signal down to -2V.

FEATURES

- Low R_{ON} : 0.4 Ω @ $V_{CC} = 3\text{ V}$ Typically
- Wide Supply Voltage Range: 1.65 V ~ 5.5 V
- Full -2 V ~ V_{CC} Signal Handling Capability
- High Off - Channel Isolation
- Low Standby Current
- Low Distortion
- Break-Before-Make (BBM) Switching
- High Continuous Current Capability: $\pm 300\text{ mA}$ Through Each Switch
- Applications in
 - Cell Phone Audio Block
 - Speaker and Earphone Switching Ring-Tone Chip
 - Amplifier Switching
 - Modems
- Available Packages: QFN1.8 \times 1.4-10L, MSOP-10L

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note 1. Defined as 10% ON, 90% OFF duty cycle.

Functional Description

This integrated circuit can be damaged by ESD if you don't pay attention to ESD protection. Linearin recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

Linearin reserves the right to make any change in circuit design, specification or other related things if necessary without notice at any time. Please contact Linearin's sales office to get the latest data sheets.

Note:

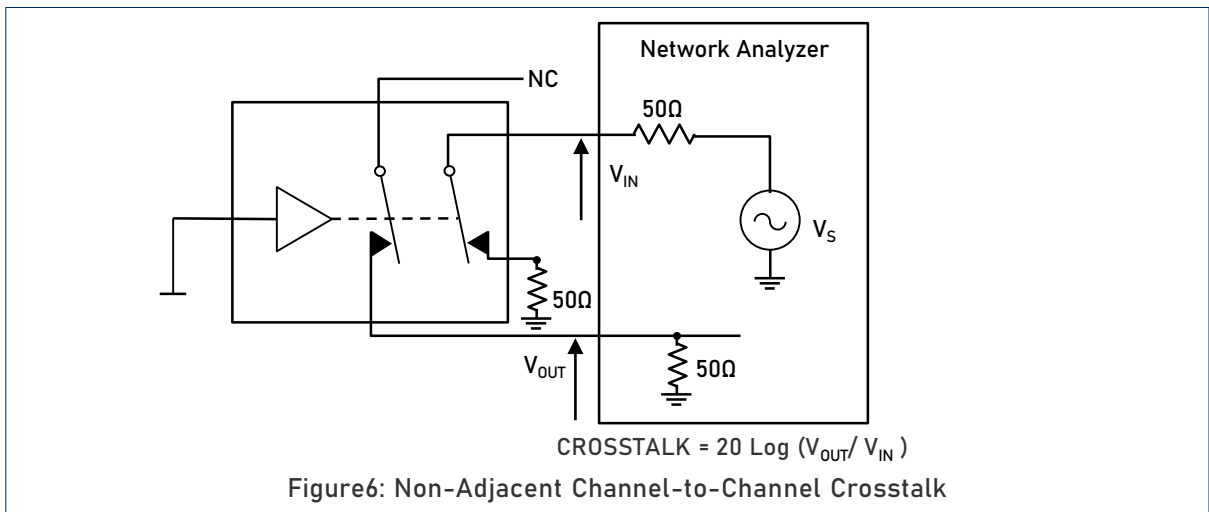

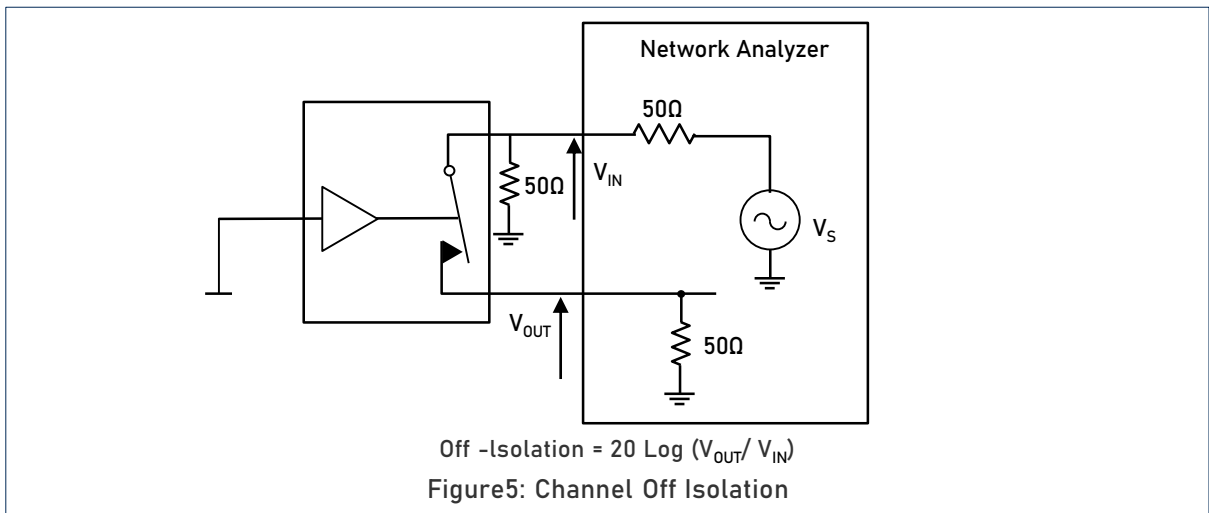

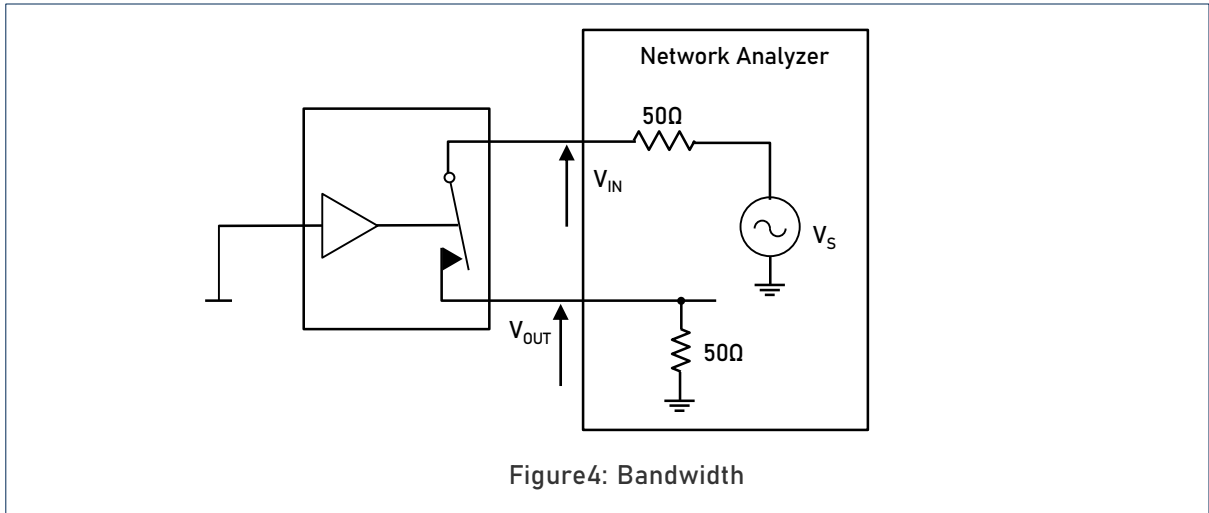

- Guaranteed by design.
- Guaranteed by design. Resistance measurements do not include test circuit or package resistance.
- $\Delta R_{ON} = R_{ON(MAX)} - R_{ON(MIN)}$ between NC1 and NC2 or between NO1 and NO2.
- Flatness is defined as the difference between the maximum and minimum value of on-resistance as measured over the specified analog signal ranges.
- Guaranteed by design in $-40^\circ C$.
